

The first thing that I had to do is to download all of the files for this course from AFS space, which I used for storage previously, and to put them into the folder with my GitHub repository. I had minor troubles because of lags on AFS; I hope that I will not experience them on GitHub. The second thing that needed to be done is the organization of all of the files for my site.

I didn't have to rename my files because I used to think about proper names for them taking into account that they will be located in web environment.

There were not many options of how to organize the files of my website. I decided to create a folder for each module in order to simplify the organization and navigation on my site. There was an opportunity to group modules one, two and three because there was only one document that is related to each one of them but I decided to spread them out because the URL links would be similar to each other for every module (for example if I group module 1 to 3 in a folder the path will look like `"/modules1-3/filename"` that is not as instinctive as just `"/module1/filename"`).

Such organization will allow me to add new modules easily without getting lost in lots of files that are related to previous modules and to access the old modules if needed.
