

In order to create a wireframe for my portfolio I had to find out the required items and their composition on a page. First of all, I reworked my content and decided that I don't need a separate page for contacts and transformed it to a contact window on the side of the pages. Also, logo, navigation bar, search and different items for different pages of portfolio should be created.

I started with positioning of items that shall appear on every page, basic elements of my portfolio: logo, navigation bar, search bar and contact window. All of them except for the last one form the header. I decided to place a logo (probably my name) because it is a remarkable item that will allow a user to remember this web site and to relate it to the actual person whose achievements it describes. Navigation and search bars are extremely useful and are integral parts any site. The decision of not to separate these two items came from an idea that they are related and it is possible to keep them close to each other.

The body part is different for the home page and for the rest of the pages with one exception: contact window, which I decided to place on the right side of the site. I don't have much contact information, so it is better to place it in a small window rather than to create a separate page for it.

The home page shall bring attention of a user from the first look, so I decided to place a picture right at the top of its body part. Which type of picture needs to be placed in there is still not decided. The pages for categories of portfolio items shall mainly contain text. I added small slots for pictures, which will represent particular items, and sub-headers in order to systemize different items in the same categories.
